FIND DATA · LEX · TECHNICAL OVERVIEW

Architecture & Private Deployment

Live platform shape, delivery-package composition, data governance, deployment roadmap. Planned capabilities are labelled v1.x.

Live platform shape (one domain, four entries)

Entries & identity

- **Four entries**: website & capability catalog / customer console (sign-up → mint a long-lived key → usage & billing) / MCP API / delivery page
- **Tenant isolation**: a dedicated customer identity organization with minimal scope — a customer key only sees the services it purchased; out-of-scope calls are rejected (403)

Services & metering

- **Legal retrieval MCP**: **10** tools [N7] — statutes / similar cases / guiding cases; every result carries provenance (source database, stable identifier, as-of time)
- **Dual-unit metering**: reads by row, generation by call; the settlement ledger is authoritative with three-way reconciliation
- **Fail-closed**: hard stop on exhausted quota (preflight rejection, 402); warnings archived at the **80%** and **95%** tiers [N16]

Delivery-package composition (cloud and customer machine room = two hosts of the same deliverable)

package: v1.x planned

Base local runtime	the local data-platform foundation providing the runtime and shared catalog plane
Contract intelligence stack	assembly-based drafting / triple review / rubric scoring, 52 MCP tools [N14]
Legal retrieval MCP service	statutes / similar cases / guiding cases under a full provenance contract
Three data tiers	reference package (statutes + article-level citations + guiding cases; mandatory base) · corpus package (five-source corpora + templates) · judgments package (full corpus, per-project legal review)
Model capability v1.x planned	private-side inference path is on the roadmap; model files are not shipped with the package before it lands
Infrastructure sidecars	vector retrieval, authentication, metering audit and supporting components

Data governance & updates

Scale & tiers

- **32,296** laws and regulations [N1] · **364,916** statute chunks [N2] · **30,151** authoritative documents [N6]
- Court judgments **37,001,012** [N4]; the full judgments package is approx. **175**GB [N15], delivered after per-project legal review

Update mechanics

- **Pull-based increments**: customers pull daily / weekly updates from distribution endpoints on a schedule — credential-authenticated, sha256-verified, resumable
- **Offline full-package fallback**: content-equivalent to the online channel, built for air-gapped networks
- **Versioned builds**: packages are versioned with component digests locked; injecting cloud-only dependencies fails the build

Deployment roadmap

Install & upgrade v1.x planned

- Single-machine docker compose install; data lands in local volumes
- Reinstall-style upgrades: version advances preserve customer data (corpora / artifacts / configuration)
- Air-gapped operation supported for reference / corpus package scenarios

Where things stand today

- The cloud host is live: entries, console, metering & settlement, legal retrieval — the full chain is in service
- Private delivery packages are scheduled per customer engagement; scope and progress follow the contract and the delivery page
